Experiment 4: Web Browser Artefacts Report

Name: Sujal Wasnik **UID:** 23015036 **Case:** practical4 (Vikrant .E01, Autopsy 4.23.1)

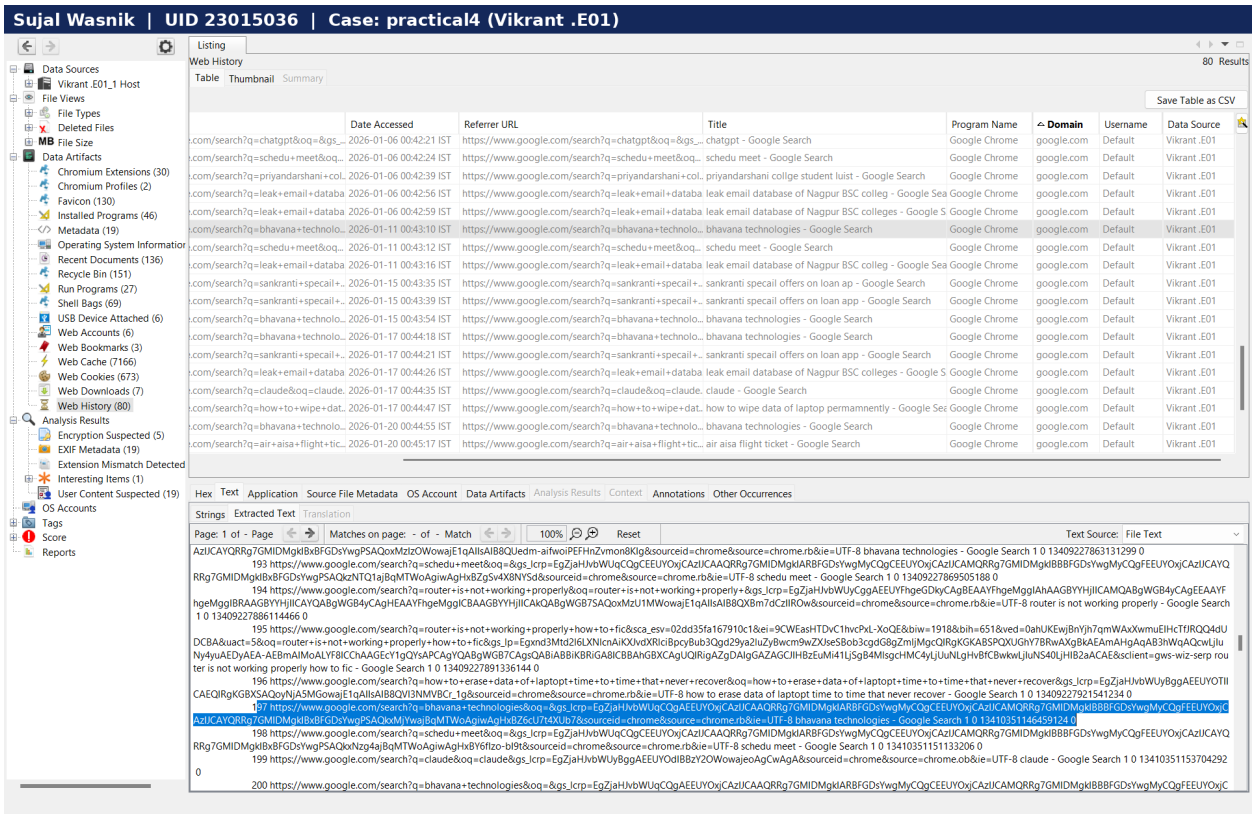

Item 1: Web Accounts Overview

Web Accounts (Data Artifacts): all six saved logins

This screenshot lists the six logins Chrome had saved on Vikrant's profile. Reddit, Instagram, Facebook and Mailchimp look like everyday personal accounts. The two that caught my eye were **bhavana%20technologies.com**, which has no decoded URL or domain, and **dashboard.bhavanatech.in**, created on 22 Oct 2025 at 14:58 IST with a strangely long email as its username.

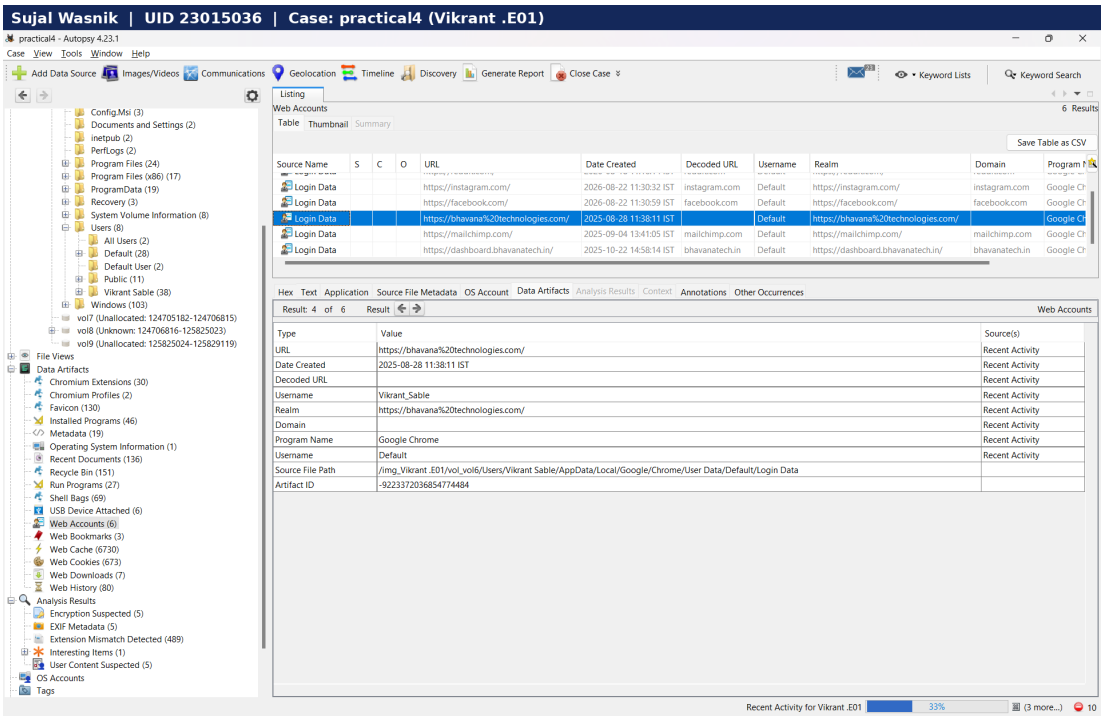

Item 2: Most-Visited Domain

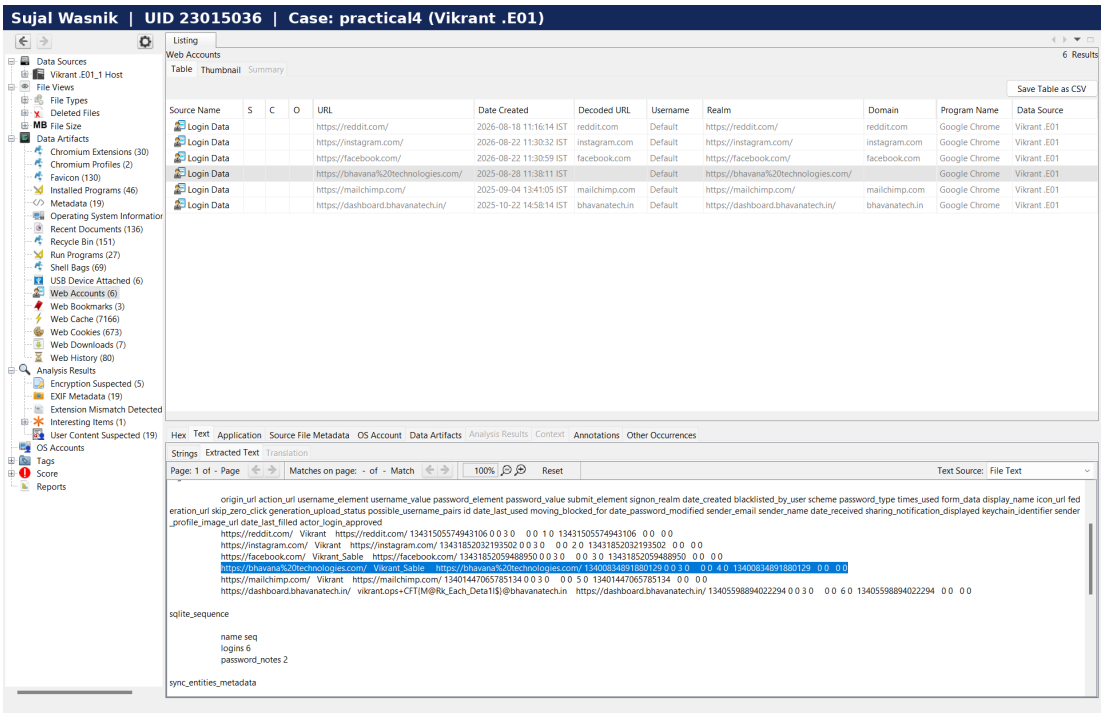

Web History sorted by Domain: google.com

Sorting Web History by Domain shows that **google.com** is the most visited by a big margin. Most of the 80 rows are Google searches and nothing else comes close. In the Chrome History database these searches are marked as coming from the address bar, so they were most likely typed. Chrome's typed count stays 0 because it only counts full web addresses, not searches. Searching *bhavana technologies* again and again over several months is what I would call routine use, unlike one-off searches such as the router or flight ones.

Item 3: Comparing the Two Similar Entries

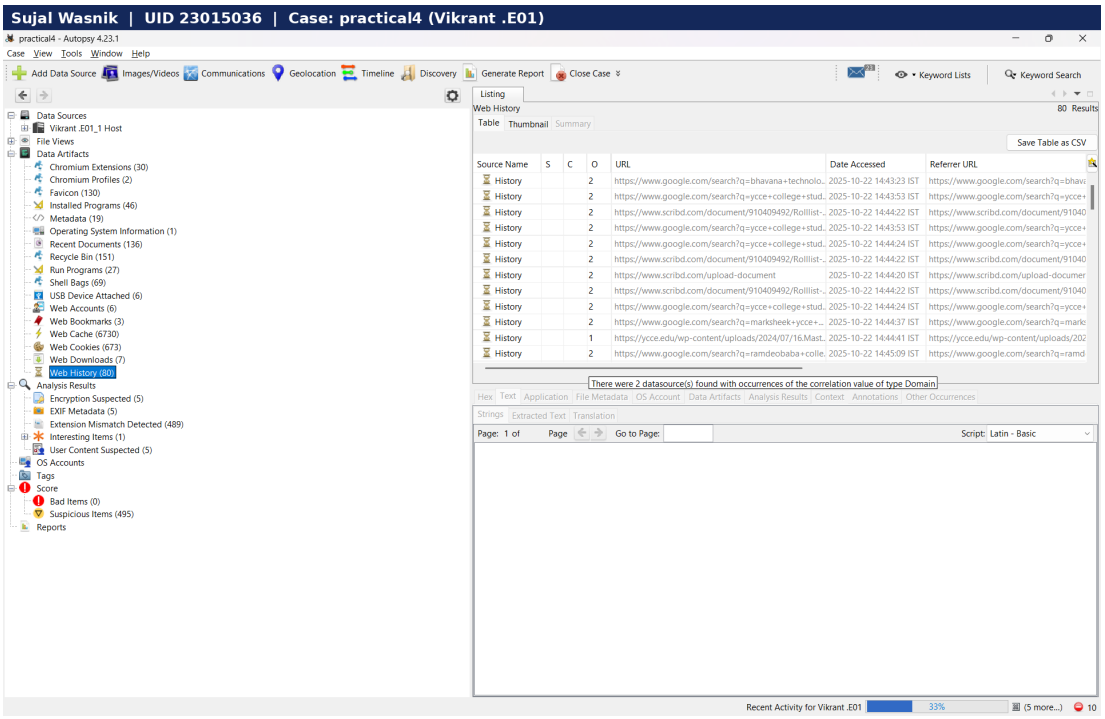

Detail panel of bhavana%20technologies.com

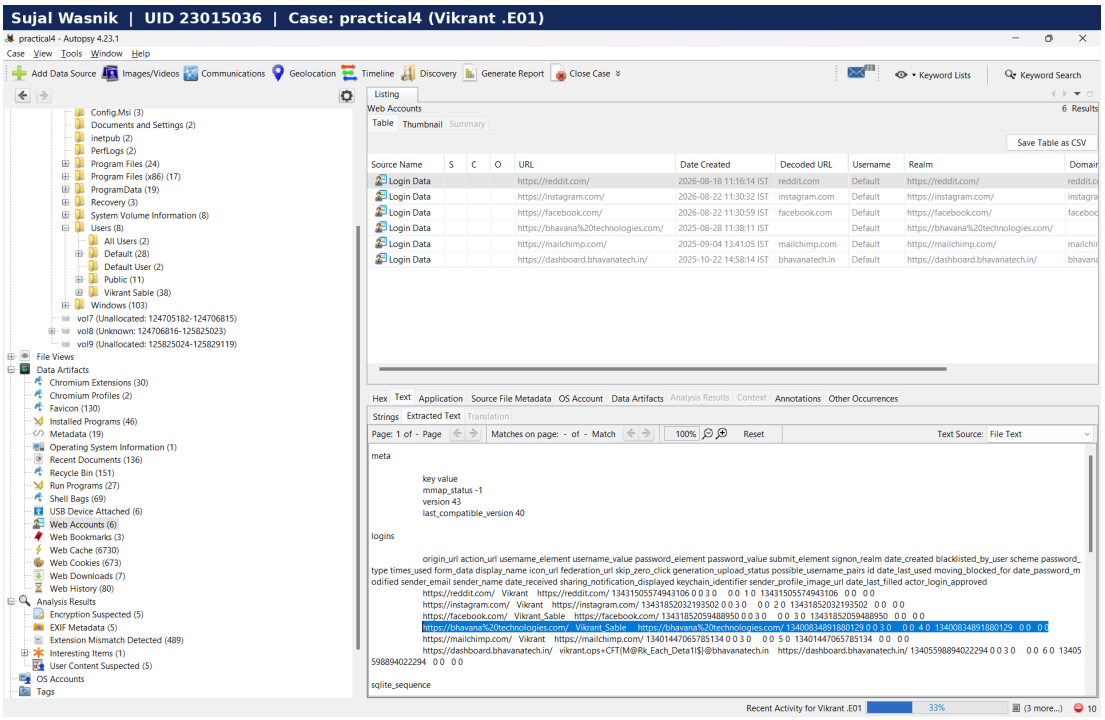

Web Accounts table showing both entries

Side by side, the difference is easy to see. **bhavana%20technologies.com** has nothing in Decoded URL or Domain, because %20 is just an encoded space and not a real address. **dashboard.bhavanatech.in** has a proper domain (bhavanatech.in) and a work-style email as its username. The %20 entry also has no matching History, Cache or Cookie activity, so it looks like a typo or leftover, while the dashboard one looks genuine.

Item 4: Organisation Identified

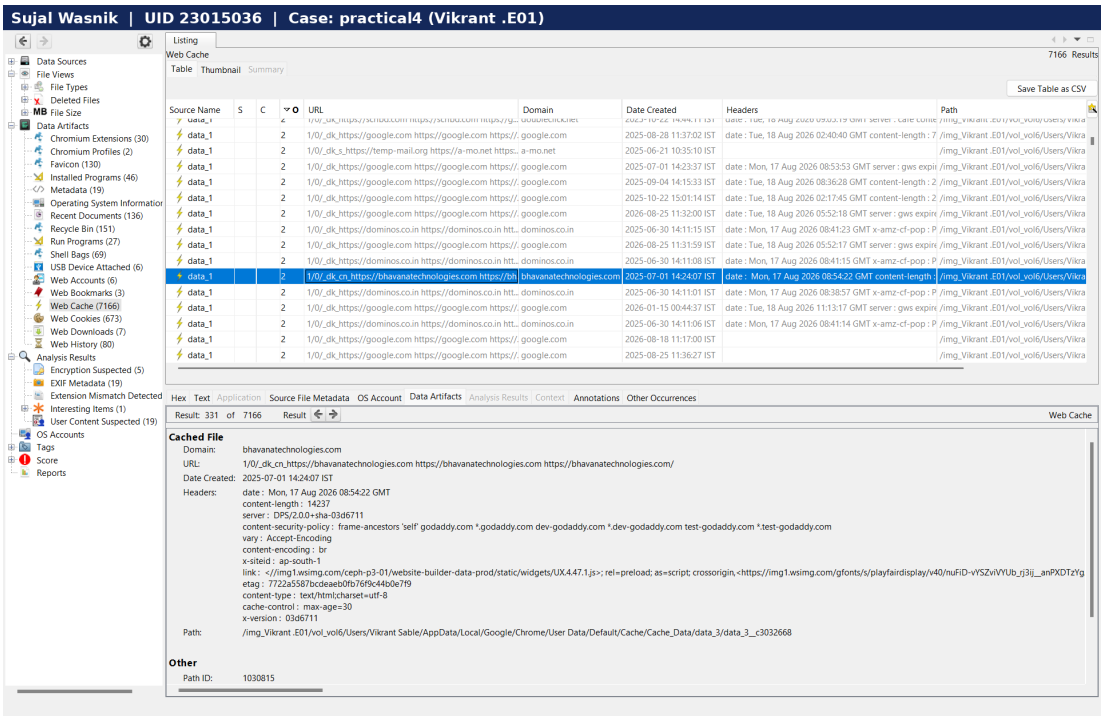

Web History: first 'bhavana technologies' search, 22 Oct 2025 14:43:23 IST

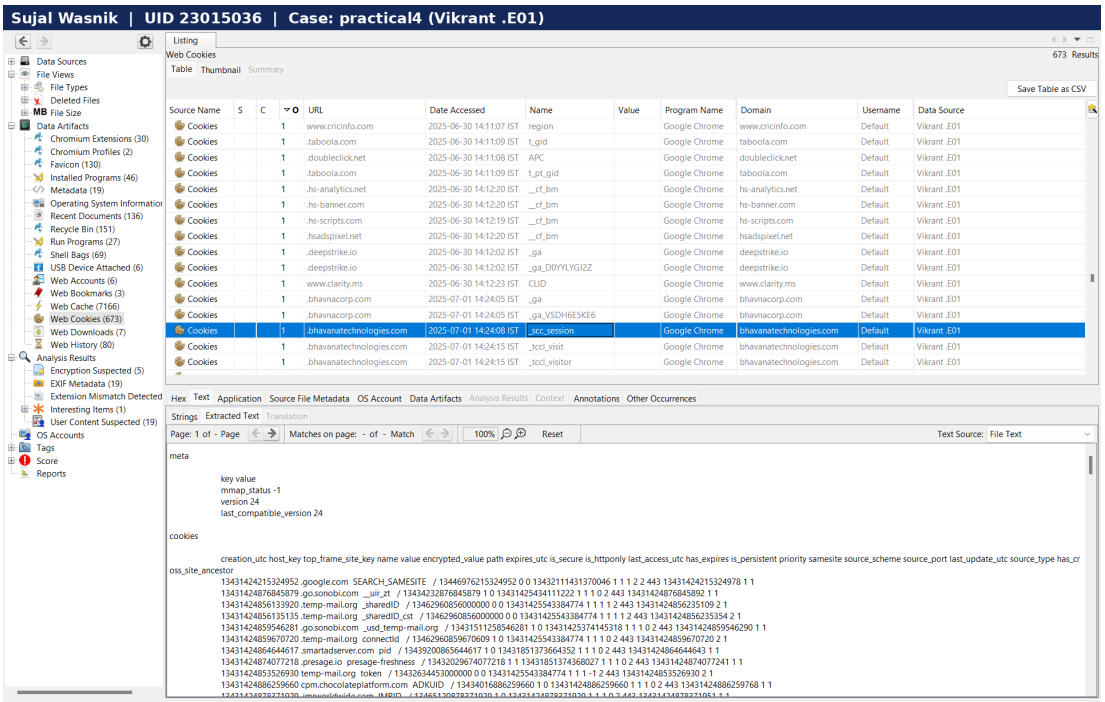

Web Accounts: dashboard.bhavanatech.in created 22 Oct 2025 14:58:14 IST

I concluded that the real account is **dashboard.bhavanatech.in**, which makes the organisation **Bhavana Technologies**. The first screenshot shows his first Bhavana search at 14:43 on 22 Oct 2025, and the second shows the dashboard login being created at 14:58 the same day, about 15 minutes later. That links Vikrant to the company, but it does not tell us what the company's part in the case is.

Item 5: Cache/Cookies Corroboration

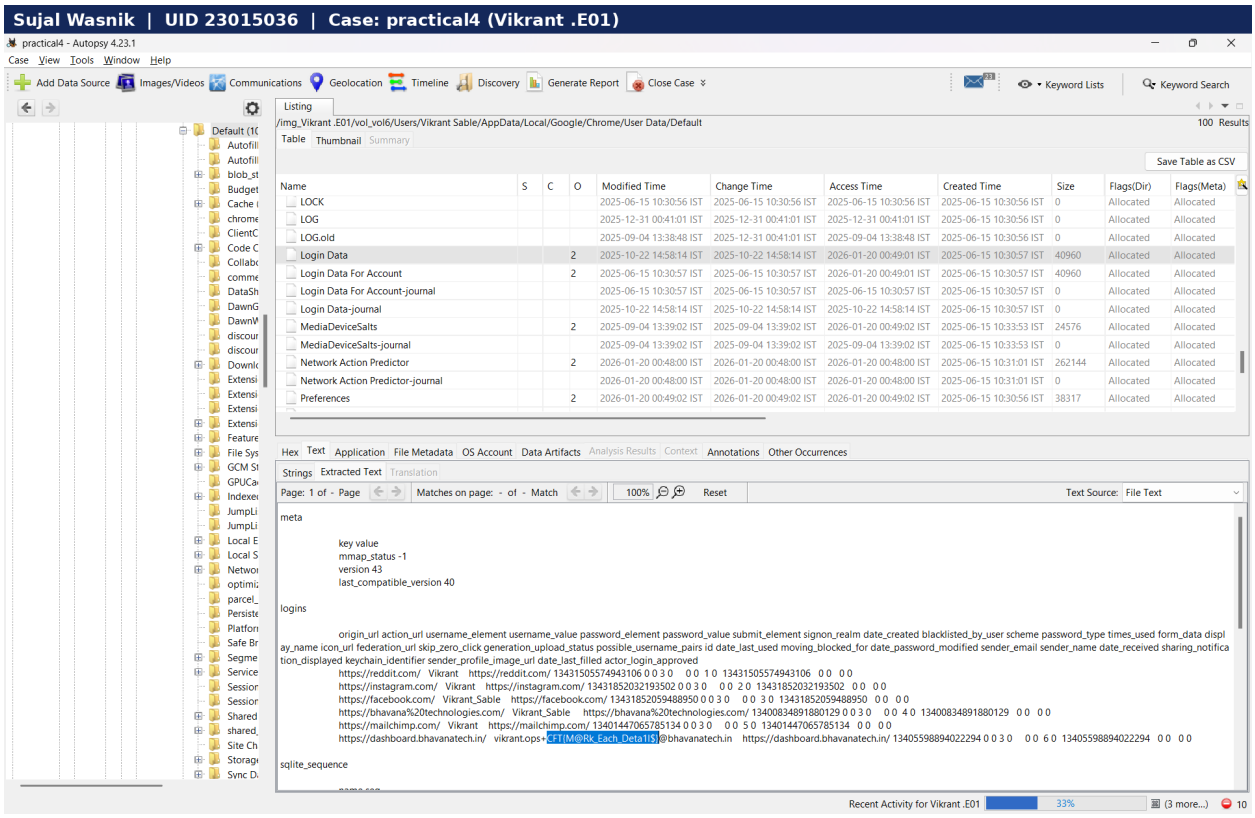

Web Cache: bhavanatechnologies.com, created 1 Jul 2025 14:24:07 IST

Web Cookies: bhavnacorp.com and bhavanatechnologies.com, 1 Jul 2025 14:24

Both the cache and the cookies show Chrome opening **bhavanatechnologies.com** on 1 Jul 2025 at around 14:24. The cookie-banner cookies suggest he actually clicked on the page and did not just load it. This backs up his interest in a Bhavana company, but I found nothing for **bhavanatech.in** itself, so cache and cookies alone can't prove the dashboard account was used.

Item 6: The Unusual Field

Login Data text view with the flag highlighted

Most usernames here are plain names, but the one for dashboard.bhavanatech.in is *vikrant.ops+CFT{M@Rk_Each_Deta1l$}@bhavanatech.in*. The part after the + sign is the flag: **CFT{M@Rk_Each_Deta1l$}**. I found it by opening the Login Data file in Chrome's Default folder and reading its Text view, so no decoding was needed.
